1. Abstract

Carpooling (also known as car-sharing, ride-sharing and lift sharing), is the sharing of car journeys so that more than one person travels in a car. Carpooling reduces each person's travels costs such as fuel costs, tolls, and the stress of driving. Carpooling is one method that can be easily instituted and can help resolve a variety of problems that continue to plague urban areas, ranging from energy demands and traffic congestion to environmental pollution. Authorities often encourage carpooling, especially during high pollution periods and high fuel prices. We intent on making an angular,node and mongoDB based web application that will enable to let people know if vehicles are available for carpool in their desired path they can sign in for it. This will enable people using this application to share expense, not worry about hiring a cab and making new connections. People having this application on their cell phone with advance facilities can easily carpool with unacquainted people without worrying about security. It will show the date to reach at particular location. It gives a better way for pooling a car with a very efficient environment that is easy to use. This is a Web-based collaboration, communications, and content delivery framework.

2.Introduction

2.1 Brief Introduction

Car Pooling is shared use of a car in particular for commuting to work, often by people who each have a car but travel together to save costs and in the interest of other social-environmental benefits.The objective of the project is to present a web based application which provides a communication platform between car owners and passengers. Car owners will be able to post a notice announcing that (s)he has been traveling between some particular locations regularly or just once, to search a travel-mate in order to reduce the ride costs.Traveller can find list of all live ride and can confirm ride by just clicking button.It also shows a list of your past ride and your offered ride.

2.2 Tools/Technologies used

Technologies:

1) HTML 5
2) Cascading Style Sheets (CSS 3)
3) Bootstrap 4
4) Angular CLI
5) Typescript
6) Node Js
7) Express Js
8) Mongo Db

Tools:

Visual Studio Code

Postman

Platform:

Localhost:4200 For Angular (ClientSide)

Localhost:7762 For NodeJs (ServerSide)

Localhost:27017 for MongoDB (Database)

3.Software Requirement Specifications

3.1 Types of User

1. Admin
2. End-User

3.2 System Function Requirement

R.1 Admin Functionality

R.1.1 Delete User Account

Description:Using this functionality admin is able to delete user by user id

Input:User Id of user whose account will be deleted

R.1.2 View User Account

Description:Using this functionality admin is able to view user

Input:User Id of user whose account will be displayed

Output:Display user information

R.1.2 Update User Account

Description:Using this functionality admin can update the user detail

Input:User Id of user whose account will be displayed

Output:Display user information

R.1.3 Check History of booking

Description: The admin will be able to check the history of booking .

Input: Admin Selection

Output:Admin can view history of whole booking system

R.2 End-User Functionality

R.2.1 Login

Description:Login operation. Check the user id and Password whether it is true or not if it is right then success message otherwise alert will be display with error message.

Input:User credential of user whose account will be verify

Output:Display user account with welcome message

R.2.2.Register

Description :User can register if he want to find ride

Input: User details

Output:Display message if wrong detail is entered by user

R.2.3 Offer Ride

Description :User can offer ride by selecting source and destination from map or manually entering on textbox.

Input: Ride details

Output:Ride details will be entering in database

R.2.4 Find Ride

Description :User can find ride from list of all live ride

Input: Ride selection by user

Output:Ride details will be entering in database

R.2.9.Past Booked Ride

Description: User can view his past journey with details of source,destination,date and fare

Input: User selection

Output:All the past ride which is booked by current user will be display

R.2.9.Past offered Ride

Description: User can view his offered ride with details of source,destination,date and fare

Input: User selection

Output:All the past offered ride which is offered by current user will be display

R.2.9 About Us

Description :User can see details about website and other info

Input: User selection

Output:Details will be display

12.Limitation and Future Extension

Limitations

1. User can not filter Ride by distance of their location or specific source to destination.So user need to check all the records
2. Once the request is made to the driver by the user,driver needs to communicate with customer by contact number which will be provided by help team. They can not further communicate via application.
3. At time of offering ride,it is possible that you can not get exact label by marker on map so some time we need to type manually Source and destination
4. No options available in application for the online payment.

Future Extension

1. Filter operation will be improved to provide best GUI to user
2. Map facility will be created accurately and using distance matrix we will provide distance between source and destination
3. Provide functionality that allows user to track booked car based on gps and for online payment.
4. Provide Platform for communication between customer and workers.
5. Allow user to cancel or update request even after it has been confirmed and notify respective driver about changes
6. 6.Implement Rating And Review mechanism to allow user to add reviews and ratings to respective driver and ride.

13.Testing

After the implementation and coding of system,comprehensive testing was performed on the system to determine possible flaws in system and loopholes of system. The testing was performed using postman as Tool,Through which we can directly pass data in JSON format as Request Data in URL.Post request can not be directly send to server but using postman we can also send a POST request.

14.Conclusion

The functionality of this system is developed after understanding whole system flow and all module and it is as per requirement.

The functionality which were successfully implemented :

1. Registration/Login
2. Offer Ride : based on google map or manually entering source and destination
3. Find Ride : Confirm ride by confirming from display list
4. View past booked ride
5. View Offered ride
6. Manage user account
7. View full profile in admin site
